

Incumbent reading
literal text, box, confidence, provider

Challenger candidates
second view, second engine, or crop specialist

Normalize and compare
casefold and collapse whitespace, extract the numeric value where one exists, then
select the best-supported challenger by agreement first and confidence second

Adoption rules, applied in order

1. the incumbent is empty and a challenger agrees → adopt the challenger
2. the incumbent boxes conflict geometrically and a challenger reads the same value → adopt
3. the incumbent is under the confidence floor and a challenger is more confident → adopt
4. otherwise the incumbent stands

Record, whichever rule fired

selected text carrying the merged evidence IDs of every supporting candidate; `alternatives[]` holding each distinct rejected reading with its own provider; `resolution` set to `conflicting` when a challenger of equal or higher confidence still disagrees with the surviving text

page evidence

`accept_local`, or review if any region is unresolved or conflicting

one rule serves tile fusion, table cells, and the handwriting sidecar; nothing in this path deletes a reading, because adoption demotes the incumbent to an alternative
